iScan Glass List Management

Legal requirements

The maintenance of the glass register according to ISO 22000 is obligatory for companies in the food and beverage industry. Meeting this standard – by ticking off and filling in different lists with a complex number of entries for glass and hard plastic parts – requires a considerable amount of organization, personnel and time, without any guarantee that the control process will be completed properly.

The use of a scanner-based control system offers safety and makes work easier. The complete cyclical control is clearly guaranteed. Any defective parts are documented and immediately reported to the maintenance department as “task to be completed”. This creates a workflow with optimized and sustainable communication between quality management, maintenance and other departments.

Quick overview

Paper-based controls are vulnerable to errors and might be incomplete. Any digital solution makes the implementation of ISO 22000 regulations easier and more secure at the same time. Documentation is digital, can be evaluated and is centrally available at any time.

Advantages

- ▶ Equipment, glass and hard plastic pieces are verifiably checked for intactness and completeness (inspection obligation).
- ▶ All documents/lists are digital and accessible at any time (storage).
- ▶ Communication between inspectors and other departments starts immediately whenever faulty parts are detected (troubleshooting).
- ▶ All data/test results are precisely documented and are also available to other departments as control instruments.
- ▶ The time and personnel expenditure for audit preparations is reduced. The results can be presented to customers at any time.

ISO 22000 as an opportunity

Keeping the glass cadastre in accordance with ISO 22000 must not only be a tiresome duty. The right implementation offers unlimited potential for the continuous improvement process (CIP) in the company.
